ANDREA CACERES

678-876-9314 | andreacac2023@gmail.com | https://github.com/andreaycaceres

SUMMARY:

Statistics and data analytics professional with a B.S. in Statistics and an M.S. in Data Science expected December 2026. Experience in statistical modeling, hypothesis testing, predictive modeling, and business-driven analysis. Seeking a role in data science, data analytics, or machine learning.

SKILLS:

Languages: Spanish
Programming Languages: Python, R, Scala
Libraries: pandas, NumPy, scikit-learn, Matplotlib, ggplot2, dplyr
Tools: Git, GitHub, GitHub Pages

EDUCATION:

University of Georgia
B.S. in Statistics
August 2019 - May 2023

University of Colorado Boulder
M.S. in Data Science
Expected December 2026
GPA: 3.75

PROFESSIONAL EXPERIENCE:

WILLIS TOWERS WATSON, Denver, CO
Pension Outsourcing Benefits Analyst, June 2023 - August 2025

- Calculated participant pension benefits using actuarial models and calculation tools ensuring accurate application of client plan provisions.
- Collaborated with internal teams to resolve participant cases, calculation questions, and documentation requirements for different client accounts.
- Managed customer service cases from assignment through resolution while meeting deadlines based on case priority and requirements.

PROJECT EXPERIENCE:

SUBSTANCE ABUSE ANALYSIS, University of Colorado - Boulder
Python | Exploratory Data Analysis | Predictive Modeling

- Identified and predicted which communities are at risk of drug abuse and or drug overdose.
- Identified which drug combinations led to a higher risk of substance abuse deaths.
- Utilized methods such as multiple linear regression and association rules.
- Distinguished if there is a seasonality pattern in substance abuse related deaths.

NATIONAL PARK CROWDING ANALYSIS, University of Colorado - Boulder
Python | Machine Learning | Predictive Modeling

- Collected, cleaned, and merged 10 years of National Park Service visitation and park characteristic data across 59 U.S. National Parks
- Applied K-Means and hierarchical clustering to identify groups of parks with similar recreation and visitation patterns.
- Used PCA to reduce dimensionality and analyze the features driving differences among parks.
- Built and evaluated classification and regression models using Naive Bayes, Decision Trees, SVM, and neural networks to predict park crowding patterns and compare model performance.
